

## Content & Usage Statistics

This module brings enhancements and additional features to the default DSpace to monitor and understand the usage of the repository both in terms of content usage and from an administrative perspective.

Access to the statistics pages can be configured separately for items, collections, communities, and the whole repository, and can be public or restricted to the administrator of the objects (Global administrators, Community administrators, Collection administrators).

## **FEATURES**

Detailed content statistics with dynamic analysis powered by the search system

Fully based on the data collected in the SOLR statistics core as by default in DSpace

Users can subscribe to daily, weekly, or monthly updates about usage statistics and they will receive excel files with total count and increment in the requested period, for all the observed items.

The information is enriched to allow an easy join between the statistics data with the content metadata, allowing aggregation by community, collection, submitter, authors, etc., without the need to rebuild the statistics data as by the current limitation of the "basic" DSpace usage analysis features.
